Emergency Technology

Covid 19. What technology (starting with robotics, but not only) would you like to see adopted to best face and manage the health emergency in our country?

This is the third challenge of Project **Scouting the Future**, promoted by the **Regione Lazio** and organised by **Lazio Innova** and the **Fondazione Mondo Digitale**, in collaboration with **Comau**.

The contest, which should have been held during the **RomeCup** Robotics Competition in April 2020 has been reorganized as a virtual format based on the health emergency. The **Virtual Reality Contest** will involve researchers, start-uppers, makers, experts and university students who have developed innovative proposals and prototypes to employ technology to address the Covid-19 pandemic.

At the final event, which will be held on-line on October 6 starting at 10:30 am, thirteen teams will present their innovative ideas and prototypes to a floor of experts from major universities in Lazio, the Chico Cluster and the Giomi Group.
